

Formal Feedback For Bill Bates

Reviewer: Elijah Lewis

This is an obstacle that's listed on our notes:

Images/Video are not currently saved, this would need to be added?

-PostProcessing/Heatmap python scripts export to excel sheet

-This needs to be tested more, not quite sure

Additionally, it seems like there's debate on whether to use raspberry pi or a dedicated pc. I lean towards pc because the aviaries we're observing are stationary and climate controlled. If you have a stance on that

Response:

Images could be saved in the command line using gdrive, automatically saving them to a google drive account programmatically for free.

xlsxwriter and matplotlib are good options for exporting data to excel sheets and support the creation of graphs in the sheet

The PC is better in almost every way, except for the price. The raspberry pi has less capabilities and is harder to use, but if anyone has experience with them it may be worth the hassle. I recommend the PC wholeheartedly, however, as I have heard the hassle cannot be understated.
